

maintenance-requests-web

Design 20261009-co-working-space-maintenance-0f9d · version 1

Approved	by Hamza (via web) on 2026-10-10
Design sha	a8c32e2da1802f0a7a72e1c9d81fcca375c92365c3bdbb80807753afbcccdaaf
Screens	2: S-1 , S-2
Flow	Sam opens Requests to scan the newest maintenance work, filter by status, or create a request in a dialog. Selecting a row opens Request detail, where Sam can advance its status; Back returns to the list with the previous filter retained.

The product and its look

Who uses it	Facilities coordinators triaging work and office staff reporting maintenance issues, represented by Sam Carter.
Where	Responsive web use between desk-based triage and on-site checks, from a desktop or phone.
Device	both
Tone	Direct, dependable, and action-oriented.
What matters most	See urgent open work at a glance, then move a request through its next valid status.
Traits	status-first, office-area specific, lightweight workflow

Drawn from

- **MaintainX**: Borrow a clear, status-forward maintenance workflow that keeps actionable work easy to scan.
- **UpKeep**: Take the practical, field-friendly approach to request details and maintenance handoffs.
- **ServiceNow**: Use restrained enterprise utility and clear service-request structure without a heavy suite frame.

Type, corners and spacing

All states

Requirements

- **REQ-1** The Hive Works maintenance app shall provide exactly two screens, Requests and Request detail, for the demo user Sam Carter with initials SC, without sign-in or role-selection screens.
- **REQ-3** The Hive Works API shall trim leading and trailing whitespace from title and description values before validation and storage, and treat a title that is blank after trimming as missing.
- **REQ-4** The Hive Works API shall accept only titles of 3 to 80 characters, areas from Kitchen, Meeting room, Open desk, Washroom, and Reception, priorities from Low, Normal, and Urgent, and descriptions of at most 500 characters when supplied, and return a validation message naming each invalid field.
- **REQ-5** When a request is created, the Hive Works API shall set the status to Open and assign the ID and UTC creation timestamp itself, regardless of caller-supplied system-controlled values.
- **REQ-7** The Hive Works API shall expose exactly four operations: list requests with an optional status filter, create a request, get a request by ID, and change a request's status; prevent changes to title, area, priority, and description after creation; and expose no request deletion operation.
- **REQ-8** The Hive Works API shall return all requests or only requests matching an optional single status, ordered newest first by creation timestamp, without guaranteeing relative order for requests with equal timestamps.
- **REQ-11** The Hive Works Requests screen shall show the Hive Works wordmark, initials SC, mutually exclusive All, Open, In progress, and Done filters with All selected by default, and a New request button.
- **REQ-12** The Hive Works Requests screen shall show each matching request's title, area, priority badge, status badge, and UTC creation date in date-only form, in newest-first order, and open the detail screen when a request row is selected.
- **REQ-13** When the user selects New request, the Hive Works app shall open a dialog with labeled Title, Area, Priority, and Description fields, Area and Priority selects containing the supported values, Priority defaulted to Normal, and Create and Cancel buttons.
- **REQ-14** When creation field validation fails, the Hive Works app shall keep the creation dialog open and show each field's validation message beneath that field.
- **REQ-15** When request creation succeeds, the Hive Works app shall close the dialog and show the new Open request at the top of the list, switching the selected filter to All if another filter was selected.
- **REQ-16** The Hive Works app shall disable the Create button and prevent duplicate create calls while a create request is being sent, and, after a non-validation creation failure, show a generic creation error while keeping the dialog and entered values open and allowing another submission.
- **REQ-17** While the request list is loading, empty for the selected filter, or unavailable, the Hive Works app shall show the corresponding loading, empty, or error state and provide Retry for the error state.
- **REQ-22** The Hive Works app shall use one light theme with a neutral background, near-black text, one primary-button brand color, one sans-serif font, Open blue badges, In progress amber badges, Done green badges, Urgent red badges, and neutral Low and Normal badges, with text on every badge.

- **REQ-23** The Hive Works app shall present labeled fields and keyboard-reachable controls on both screens and provide stacked request cards at 375 px and a request table at 1280 px viewport widths without horizontal page scrolling.

States: creation dialog open, submitting, creation success, field validation errors, loading, empty, error with Retry, creation error, Dialog: New request, Toast: Request created and added to the..., Full data

creation dialog open

20261009-co-working-space-maintenance-0f9d

Sam opens Requests to scan the newest maintenance work, filter by status, or create a request in a dialog. Selecting a row opens Request detail, where Sam can advance its status; Back returns to the list with the previous filter retained.

NO SCREEN

REQ-2 The Hive Works data model shall define only maintenance request records with a system-generated ID, a UTC creation timestamp, a required title, area, priority, and status, and an optional description. (no screen: The request record schema and system-generated fields are backend data-model rules, not a user-facing screen.)

REQ-6 The Hive Works app shall initialize an empty database with exactly eight seed requests, including four Open requests with one Urgent request, two In progress requests, two Done requests, and every supported area represented, and, when initialized with a nonempty database, preserve all existing requests without inserting seeds. (no screen: Database seeding and preserving a nonempty database are initialization behavior with no direct UI.)

REQ-24 The Hive Works project shall include automated tests for request creation and validation, all allowed and disallowed status transitions, filtered newest-first listing, and unknown-ID handling. (no screen: Automated test coverage is a project implementation requirement, not a screen users see.)

REQ-25 The Hive Works project shall include an end-to-end test for the create, detail, status-change, and filter workflow. (no screen: The end-to-end workflow test is project verification, not a user-facing screen.)

The Hive Works app shall initialize an empty database with exactly eight seed requests, including four Open requests with one Urgent request, two In progress requests, two Done requests, and every supported area represented, and, when initialized with a nonempty database, preserve all existing requests without inserting seeds. (no screen: Database seeding and preserving a nonempty database are initialization behavior with no direct UI.)

REQ-24

The Hive Works project shall include automated tests for request creation and validation, all allowed and disallowed status transitions, filtered newest-first listing, and unknown-ID handling. (no screen: Automated test coverage is a project implementation requirement, not a screen users see.)

REQ-25

The Hive Works project shall include an end-to-end test for the create, detail, status-change, and filter workflow. (no screen: The end-to-end workflow test is project verification, not a user-facing screen.)

Requirements

- **REQ-7** The Hive Works API shall expose exactly four operations: list requests with an optional status filter, create a request, get a request by ID, and change a request's status; prevent changes to title, area, priority, and description after creation; and expose no request deletion operation.
- **REQ-9** When a client requests a request by ID, the Hive Works API shall return the matching record if it exists and report not found if it does not.
- **REQ-10** The Hive Works API shall allow only the status transitions Open to In progress, In progress to Done, and Done to Open, and reject every other status-change request, including requests for an unknown request ID or an unsupported status value, without changing the stored status of any existing request.
- **REQ-18** The Hive Works Request detail screen shall show a Back link, the request title, area, priority badge, status badge, UTC creation date in date-only form, and the description or "No description." when absent, and return to the Requests list with its previously selected filter retained when Back is followed.
- **REQ-19** The Hive Works Request detail screen shall show Start work for Open requests, Mark done for In progress requests, and Reopen for Done requests, and update the status badge and action button only after a successful status-change response.
- **REQ-20** If a status update fails, then the Hive Works app shall show "Could not update the request." and keep the previously displayed status and action unchanged.
- **REQ-21** The Hive Works app shall show "Request not found." with a link back to the Requests screen for an unknown ID, and show a generic loading error with Retry but not "Request not found." when loading a known ID fails for another reason.
- **REQ-23** The Hive Works app shall present labeled fields and keyboard-reachable controls on both screens and provide stacked request cards at 375 px and a request table at 1280 px viewport widths without horizontal page scrolling.

States: not found, status updated, loading, load error with Retry, status update pending, status update error, Toast: Could not update the request., Full data

NO SCREEN

REQ-2 The Hive Works data model shall define only maintenance request records with a system-generated ID, a UTC creation timestamp, a required title, area, priority, and status, and an optional description. (no screen: The request record schema and system-generated fields are backend data-model rules, not a user-facing screen.)REQ-6 The Hive Works app shall initialize an empty database with exactly eight seed requests, including four Open requests with one Urgent request, two In progress requests, two Done requests, and every supported area represented, and, when initialized with a nonempty database, preserve all existing requests without inserting seeds. (no screen: Database seeding and preserving a nonempty database are initialization behavior with no direct UI.)REQ-24 The Hive Works project shall include automated tests for request creation and validation, all allowed and disallowed status transitions, filtered newest-first listing, and unknown-ID handling. (no screen: Automated test coverage is a project implementation requirement, not a screen users see.)REQ-25 The Hive Works project shall include an end-to-end test for the create, detail, status-change, and filter workflow. (no screen: The end-to-end workflow test is project verification, not a user-facing screen.)
